## — INSTRUMENT COMPANY —

This time of year the top calls are all about heating. How do I turn my heats on? How do I program them? Can I get alerts about low temperatures?

The video and buttons below outline how to program our ClimateBoss and Classic controllers.

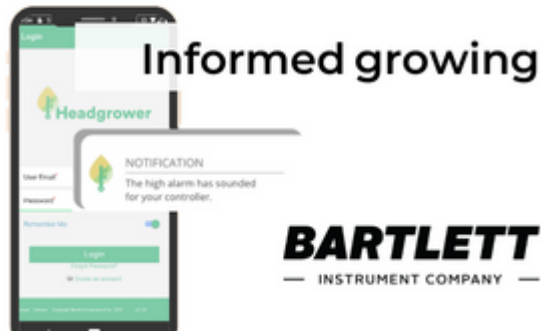

Classic GHK Programming

Classic RWL Programming

### Stay Informed

If you have Headgrower, you can get alerts to your phone about low (and high) alarm temperatures, if your controller goes offline and more. Our controllers also have an alarm output you can use if you would like to manually configure alerts.

If you have a WeatherBoss - you can get alarms about wind (speed and direction) and rain.
