Want To Know What It Costs to Fire Your Kiln?

[Home](#) • [Overview](#) • [V6CF](#) • [RTC1000](#) • [3Key](#) • [Data Logger](#)

The RTC1000 has many great features, but did you know you could calculate the cost of firings? You just need to input two pieces of information (cost of electricity per kilowatt-hour and wattage rating of the kiln) into the controller and it will calculate it for you. The calculation will only be accurate if the correct information is added into the controller.

First, enter the cost of electricity per kilowatt-hour and the wattage rating of the kiln:

- Press "Enter" until ---- is displayed.
 - Press "Menu" (o) key and RECL will be displayed.
 - Repeatedly press "Menu" (o) until COST is displayed.
-
- Press "Enter" and it will alternate between cost and a 4 digit number
 - Enter the price of electricity per kilowatt-hour (Ex: Price = \$0.071, Enter 0071)
 - Press "Enter" and it will alternate between WATT and a 4 digit number.
 - Enter the wattage rating of the kiln divided by 10. (Ex: Rating = 11650, Enter 1165)

To check the cost of firing after a firing, simply press the Program Review key and wait for COST to be displayed. The number displayed after that is the cost of the previous firing. If currently firing and Program Review is press, it will display the cost of firing of the firing in progress. If you've got questions give us a call and we'll walk you through it!
